

CLASH OF THE CLAWS

RVCE_WeaveClaw

*A local-first, self-learning
automation layer for Samsung's
AI ecosystem built on OpenClaw.*

By:

- Rahul Rajesh Raikar
- Saarthi Bhatia
- Amisha Pai
- Rajat G A

THE PROBLEM:

TOO MUCH FRICTION

- **The Issue:** Setting up automations requires manual menu navigation and technical knowledge.
- **The Impact:** Most enterprise employees and everyday users simply don't bother setting them up.

CLOUD DEPENDANCY & PRIVACY

- **The Issue:** Current market leaders (Google, Alexa, Copilot) process commands in the cloud.
- **The Impact:** This creates unacceptable data protection risks for enterprise environments and privacy-conscious users.

Theme 2 – Daily Utility (Smartphones)

Smartphones are the center of our daily routines, yet automating them currently requires too much friction and sacrifices user privacy.

THE DEVELOPER WALL

- **The Issue:** OpenClaw is a powerful foundation, but building for it currently requires manually writing YAML, action chains, and Android intents.
- **The Impact:** Most enterprise employees and Galaxy users have the need for automation but lack the technical patience to bridge the coding gap..

SAMSUNG CONSUMERS & ENTERPRISE EMPLOYEES HAVE REPETITIVE TASKS. NOBODY WANTS TO SPEND 20 MINUTES AUTOMATING ONE.

Your device is smart. Your workflows still aren't.

- Describe what routine/ automation you want to build in plain English.
- Qwen3-Coder-30B LLM instantly generates a structured logic.

Describe it in plain English

01

Surgical Core

- Instead of app bloat, we use crafted, lightweight .sh scripts. These use direct Android intents for instantaneous, absolute control over the hardware without wasting compute.

02

Spots Your Patterns Automatically

- The Heartbeat Daemon runs silently in the background, watching how and when you use your routines.
- It spots patterns and proactively offers to automate your daily routines before you even think to ask.

04

Visual Intelligence

- For complex UIs without deep links, our vision agent takes over.
- It reads UI bounds from the graphics buffer and navigates exactly like a human user—tapping, swiping, and typing.

03

OUR SOLUTION...

WEAVE CLAW

WeaveClaw is the missing bridge. It converts natural language into durable, repeatable, real-world action..

You could spend months building one highly specific, clever use case. But user needs are infinite. So instead of building a single use case, we built the intelligence layer that automates the creation of **any** use case.

CURRENT SOLUTIONS AVAILABLE & GAPS

Feature	 WeaveClaw	 Bixby Routines	 IFTTT	 Apple Shortcuts	 Microsoft Copilot
 Natural language creation	✓	✗	✗	Partial	✓
 Private Edge	✓	✗	✗	✗	✗
 Proactive behavioral learning	✓	✗	✗	✗	Partial
 Native Bash Execution	✓	✗	✗	✗	✗
 Conversational Chat Interface	✓	✗	✗	✗	✓
 Enterprise-ready	✓	Partial	✗	✗	✓

WALKTHROUGH

1. Telegram Bot Interface

2. Qwen3-Coder Intent Parsing

3. Autonomous JSON Writing

4. Hardware & OS Control

WALKTHROUGH

1. Natural Language Scheduling

2. Automated App Navigation

3. Physical Hardware Response

The features created are demo blueprints, **not a ceiling.**

WeaveClaw was built as an **open automation canvas.**

The routines above were designed purely to demonstrate breadth —
from **personal safety** to **developer tooling** to **smart home control.**

In practice, **any workflow** you can describe in **natural language**
can become a WeaveClaw routine.

The only limit is your **creativity.** ✨

System Architecture & Tech Stack

OpenClaw Components Used

- Heartbeat Daemon
- Modular Skill Engine
- Multi-Channel Interface
- Local Execution Runtime
- Proactive Suggestion Layer (WeaveClaw extension)
- Visual Agent (AGENTS.md)

Platforms & Ecosystem

- Samsung Galaxy (Android)
- Samsung DeX
- Samsung SmartThings
- Samsung Health
- GitHub

Libraries & Frameworks

- Qwen3-Coder-30B (Private Edge/Homelab)
- Bash / Shell Scripting
- JSON / Local File System
- Termux & Shizuku
- YAML/JSON Skill Schema

APIs & Integrations

- SmartThings REST API
- Samsung Health API
- GitHub Webhooks
- Telegram Bot API
- Android Intents & Deep Links
- General REST Webhook Listener

Impact & Use cases

NO DEVELOPER MINDSET REQUIRED

- Our local Qwen3-Coder-30B model translates natural Telegram chat directly into surgical bash scripts and SmartThings API payloads.
- *The win: OpenClaw's addressable market grows from developers to everyone with a Galaxy device.*

ACCESSIBILITY
LAYER

Journey 1: The Everyday User (Accessibility)

The Scenario: Elderly Accessibility / Smart Home Control.

User Input

"Play my TV show at 7:30 PM and switch to the news at 8:30 PM."

System Action

- Translates Telegram text into scheduled SmartThings hardware actions via local shell scripts. No complex TV remotes or menus required.

The Win

- Absolute digital inclusion. Transforming a chat box into a universal remote.

Journey 2: Enterprise Developer (Productivity)

The Scenario: Autonomous DevOps & Physical Alerts.

User Input

"Watch my git repo. If a buggy push happens, turn the lights red."

System Action

- Detects the error, blinks room lights red, autonomously corrects the code, pushes to a new branch, and turns lights green.

The Win

- Merging CI/CD pipelines directly with physical environments through natural language.

DIFFERENTIATION

MOAT 01: INTELLIGENCE

Proactive Learning

Unlike rigid, menu-driven competitors (Bixby, Shortcuts), our **quantized Qwen3-Coder-30B** model dynamically translates unstructured Telegram chat into surgical bash scripts and API payloads in milliseconds. It doesn't just trigger actions; it writes the code to execute them on the fly.

MOAT 02: SECURITY

Local-First Trust

Cloud agents (Google, Copilot) are a non-starter for enterprise. Our **Private Edge architecture** runs a massive **30-billion parameter model** locally. This zero-cloud execution aligns perfectly with Samsung Knox, meaning tech giants cannot pivot to our privacy model without dismantling their cloud data businesses.

MOAT 03: EXECUTION

Surgical OS Control

Standard assistants rely entirely on official APIs. WeaveClaw uses **lightweight .sh scripts, native Android Intents**, and **Visual Agent** that reads UI bounds to physically navigate the screen. If an app lacks an API, our agent takes over—making WeaveClaw the universal interface for the entire Galaxy ecosystem.

Demo Link

- **Project Demo Video:** A concise walkthrough (7 minutes) demonstrating the problem, core features, and an end-to-end usage scenario. Link: <https://youtu.be/EhbdY2jqGbo>
- **GitHub Repository:** Complete source code and documentation for the entire project, including setup instructions, implementation details, and supporting files. Link: https://github.com/RahulRR-10/RVCE_WeaveClaw
- **AI Disclosure:** A brief statement describing which AI models and tools were used, how they were applied, and any data or privacy considerations (e.g., on-device vs. cloud processing). Link: https://drive.google.com/file/d/1leLZSJZ5mv1m6ZeR9zOi3Co_q2UnTiKg/view?usp=drive_link
- **Project Presentation (PPT):** Slide deck (PPTX) summarizing the problem, solution, architecture, demo highlights, and usage / deployment notes. Link: <https://canva.link/o31ar7ky0h0vwbz>

SAMSUNG ALIGNMENT

OpenClaw gives us the execution foundation – WeaveClaw is the missing intelligence layer.

Weaveclaw is the automation layer Samsung's ecosystem has been missing.

SmartThings

WeaveClaw calls SmartThings APIs natively. Every user intent translates directly into SmartThings hardware actions via local bash scripts—adding a conversational intelligence layer on top of Samsung's billion-user platform.

DeX

DeX users are power users managing complex workflows. By simply typing in a chat app like Telegram, they gain automation superpowers without requiring IT configuration—making DeX genuinely enterprise-ready.

Knox

Our local-first execution via the quantized Qwen3-Coder-30B model aligns perfectly with Knox's 'zero-cloud' enterprise security mandate."

Bixby

Goes beyond Bixby. While Bixby is menu-driven and rigid, WeaveClaw is fluid, conversational, and instantly executable through a simple chat interface.
